DATA ANALYST INTERNSHIP — TASK 2

Data Visualization and Storytelling

Objective: Create visualizations that communicate a clear story from sales data.

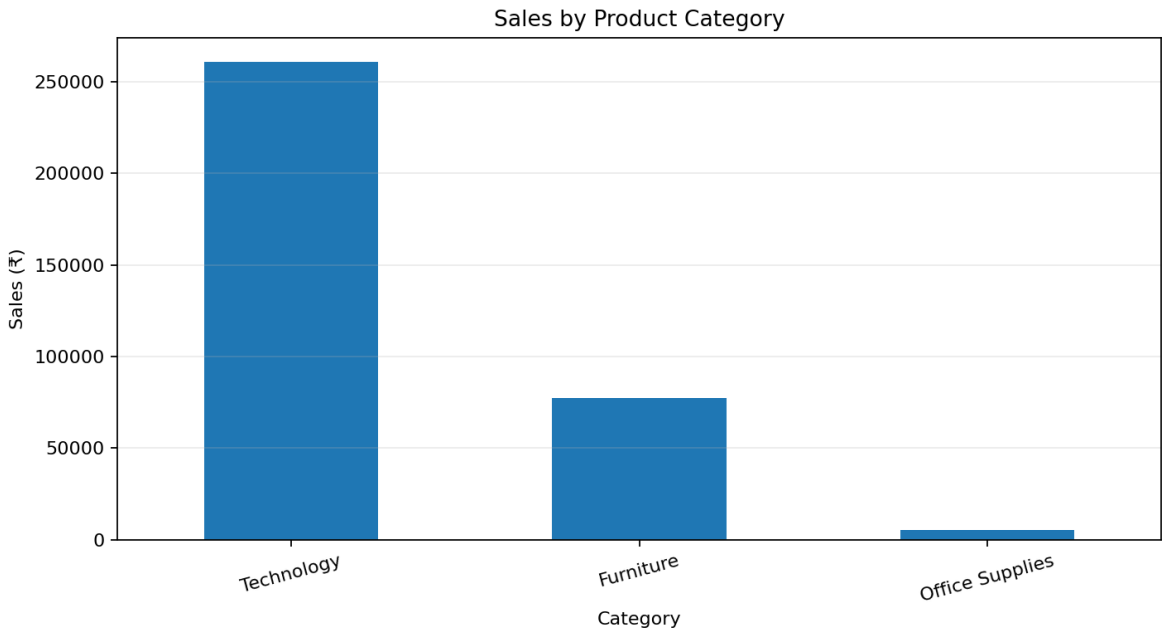

Dataset and method

This report uses a reproducible sample sales dataset. The workflow removes duplicate rows, handles missing values, converts dates, and groups sales by category, region, month, and product.

Key Performance Indicators

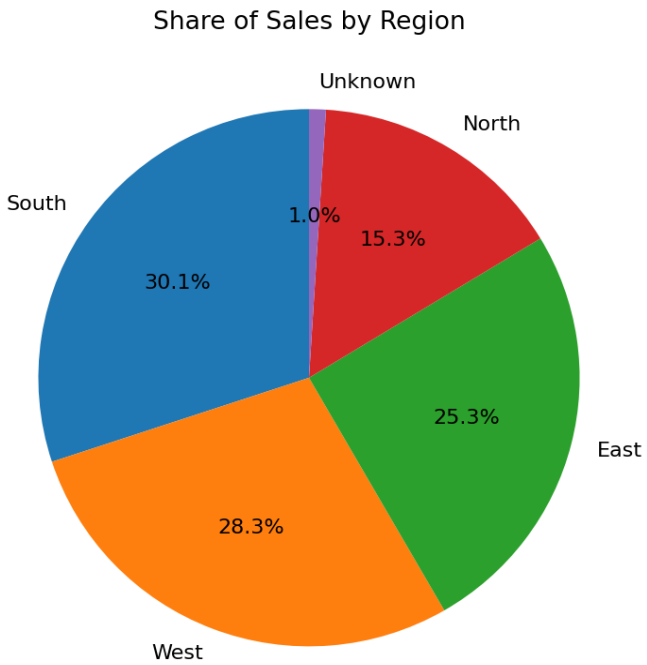

Metric	Result
Total sales	■343,334.20
Total profit	■91,321.01
Unique orders	240
Average sales per order	■1,430.56

1. Sales by Product Category

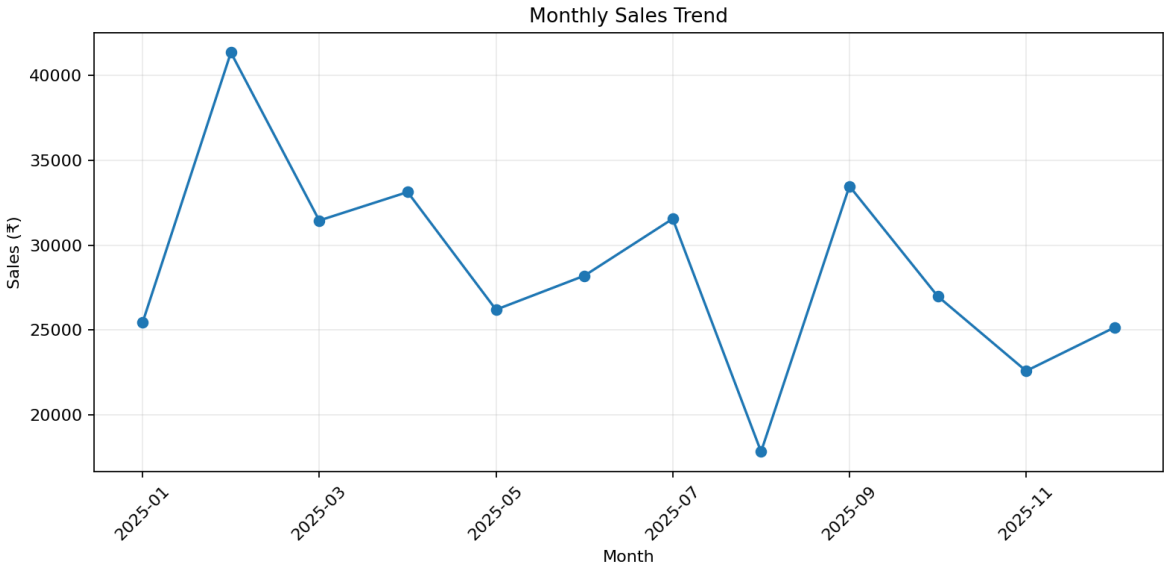

Insight: Technology is the highest-sales category in this sample. The bar chart makes category comparisons easy.

2. Share of Sales by Region

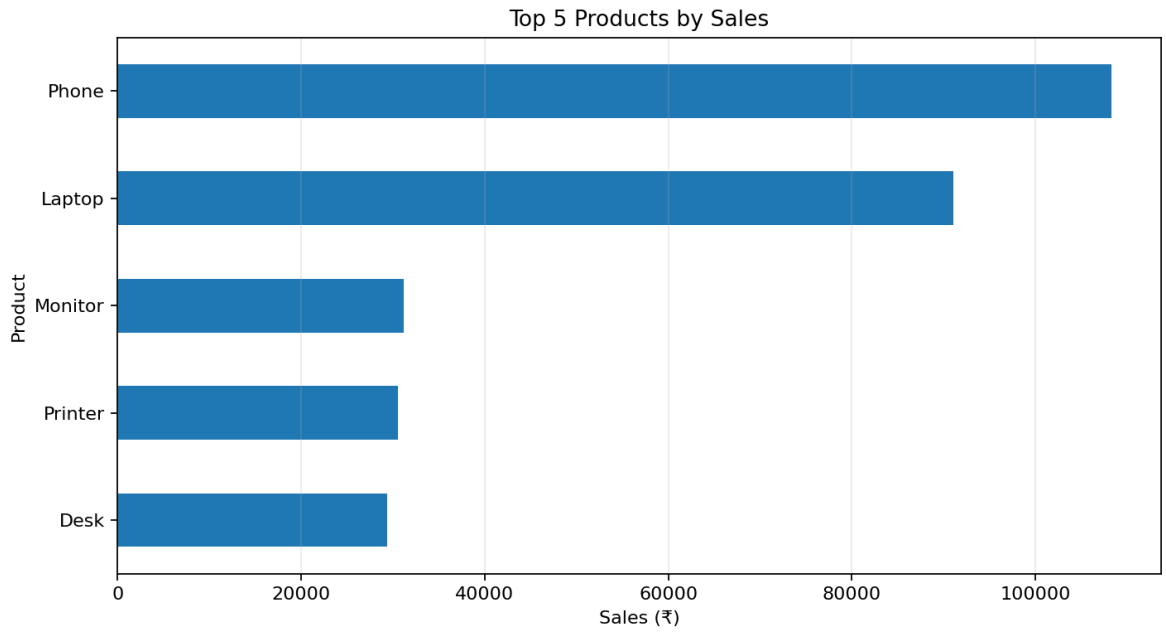

Insight: South contributes the largest regional sales total in this sample.

3. Monthly Sales Trend

Insight: The line chart highlights monthly changes and helps identify stronger and weaker periods.

4. Top 5 Products by Sales

Insight: Phone has the highest sales among the five products shown.

Business Recommendations

• Review stock levels for high-performing categories and products.
• Compare regional performance and investigate lower-sales regions.
• Use monthly trends to support inventory and promotional planning.
• Track profit as well as sales so that high revenue is not mistaken for high profitability.

Conclusion

The project demonstrates how data cleaning, analysis, and suitable charts can turn raw sales records into understandable business insights. All results are based on the sample dataset included with this project.

Note: This is synthetic sample data prepared for learning and internship-task demonstration. Replace it with an authorized Superstore.csv or other approved sales dataset if required.
